

BIRKETT SAFEFLO SERIES SAFETY AND THERMAL RELIEF VALVES

A range of thermal relief valves for smaller gas or liquid applications, relieving thermal expansion of process fluids in vessels and long pipes

FEATURES

- Wide choice of materials includes non-ferrous for low temperature and oxygen service and exotic alloys for the chemical and process industries.
- Simplified maintenance for flanged valves via a slip on inlet flange enabling easier realignment into existing pipework after servicing.
- Interchangeable parts enable easy modification from gas to liquid or liquid to gas with the minimum number of parts.
- D Series is certified for all media without modification.
- Proven dependability ensures safe and reliable performance.
- Optional cleaning for cryogenic and oxygen services available.
- Balanced piston available on the 7D Series to counter the effects of variable back pressure.

GENERAL APPLICATION

Safeflo valves relieve excess pressure caused by thermal expansion in small capacity pumps, pipe work, tanks, calorifiers, gas and oil separators and long lengths of pipework. Models are available for gas, steam, vapor and liquid applications.

TECHNICAL DATA

Materials:	Carbon steel, stainless steel
Sizes:	1/2" x 1" to 1 1/2" x 2" (DN 15 to DN 40)
Connections	
Threaded:	1/2" to 2"
Flanged:	1/2" to 1 1/2"
Pressure range:	5 to 5000 psig (0.35 to 345 barg)
Temperature range:	-320° to 1000°F (-196° to 538°C)

BIRKETT SAFEFLO SERIES SAFETY AND THERMAL RELIEF VALVES

OVERVIEW

1. Wide range of accessories - available to comply with international codes and to suit system requirements.
2. High performance springs - safety relief valve springs are specially designed to guarantee set point repeatability.
3. Guiding surfaces - the material selection of guiding components, together with self-aligning disc pivot points, ensures correct alignment and no galling of guiding surfaces.
4. Trim - B/C Series valves have been designed with metal trim to give optimum performance at higher pressures. The 7D is available with a soft seat or metal seat, while the 6D is metal seated only.

MODEL OPTIONS

Safeflo valves are available in three different valve types to suit differing service requirements:

B Series for gas/vapor duty.

C Series for liquid duty.

D Series for gas, liquid and steam duties.

Standards and approvals

Quality standard:	ISO 9001:2008
Boiler and pressure vessels:	ASME VIII PED 97/23/EC
Mechanical Engineering Directive:	ATEX 94/9/EC
Sizing and selection:	API 520: Part 1 ISO 4126
Dimensions:	API 526
Leakage rates:	API 527
Flange ratings:	ANSI B16.5

BIRKETT SAFEFLO SERIES SAFETY AND THERMAL RELIEF VALVES

OPERATION

PRINCIPLE OF OPERATION

Safety relief valves use a spring force to hold a disc against a nozzle. Under normal system operating pressure, the valve will remain closed as the spring force is greater than the inlet system pressure force. The valve opens when the system pressure force becomes greater than the closing force of the spring.

Safeflo valves are designed to have a short simmer, open rapidly to full lift position and then re-seat at a controlled shut off pressure.

This is demonstrated in the graph below, which shows the valve action and corresponding pressure at the valve inlet.

BIRKETT SAFEFLO SERIES SAFETY AND THERMAL RELIEF VALVES

OPERATION

LIFT CYCLE

Stage 1 - Closed

Inlet pressure < set pressure

Inlet pressure is below the set pressure. The valve is closed and there is no flow through the valve.

Stage 2 - Simmering

Inlet pressure is = > set pressure and < popping pressure

Inlet pressure increases to set pressure. At this point, the spring force and system pressure force are equal; a further rise in inlet pressure will then begin to lift the disc slightly. A small amount of fluid is released into the huddling chamber (the valve simmers). The system fluid is now acting on a larger area inside the huddling chamber.

Stage 3 - Popping and opening

Inlet pressure = > popping pressure, valve fully open

The inlet pressure acting on a larger area produces a significant force to accelerate the opening. A combination of this pressure force, the kinetic energy from the fluid within the nozzle and the deflection force of the fluid flow turning through the reaction hood is transformed into disc lifting force. The valve pops open at < 5% overpressure and the valve reaches the full open position at 110% of set pressure, in accordance with international codes.

Stage 4 - Reseating

Inlet pressure falls to re-seating pressure

As system pressure starts to fall, the force from the spring begins to close the valve. Typically, the system pressure falls between 5-10% below the valve set pressure at which point the spring force accelerates the valve disc to re-seat the valve. The difference between the set pressure and the re-seating pressure is known as blowdown.

Minimum set pressure

7D (gas, steam or liquid) = 5 psig (0.35 barg)
 6D (gas, steam or liquid) = 740 psig (51 barg)

Temperature range (with suitable material selection)

6D and 7D -51°F to 500°F (-46°C to 260°C)

BIRKETT SAFEFLO SERIES SAFETY AND THERMAL RELIEF VALVES

ACCESSORIES

Packed lever

The design of the packed lever assembly ensures that leakage does not occur when the valve is open or when back pressure is present.

PACKED LEVER

Balanced piston

This option is designed to overcome the effects of variable back pressure and is only available on the 7D Series valves.

BALANCED PISTON

Test gag

The test gag is used to prevent the safety valve from lifting and is used mainly when carrying out a hydrostatic test on the system, during commissioning.

After testing, the test gag must be removed and replaced with the sealing plug.

TEST GAG
